Service set (802.11 network)

OverviewExtended service setBasic service set typesService set identifier

An extended service set (ESS) is a wireless network, created by multiple access points, which appears to users as a single, seamless network, such as a network covering a home or office that is too large for reliable coverage by a single access point. It is a set of one or more infrastructure basic service sets on a common logical network segment (i.e. same IP subnet and VLAN). Key to the concept is that the participating basic service sets appear as a single network to the logical link control layer by using the s

ESS Networks Company Profile , Management and Employees List
